Solve me first

Problem Statement

This is an introductory challenge. The purpose of this challenge is to give you a working I/O template in your preferred language. It includes scanning 2 integers from STDIN, calling a function, returning a value, and printing it to STDOUT.

Your task is to scan two numbers from STDIN, and print the sum A+B on STDOUT.

Note: The code has been saved in a template, which you can submit if you want.

Input Format
This section specifies the Input Format.
Given A and B on two different lines.

Output Format
This section specifies the Output Format.
An integer that denotes Sum $(A + B)$

Constraints
This section tells what input you can expect. You can freely assume that the input will remain within the boundaries specified. As an example here given below, A and B will never be below 1 or above 1000.
$1 \leq A, B \leq 1000$

Sample Input

```
2
3
```

Sample Output

```
5
```

The above sample should be taken seriously. The input will be 2 and 3 in 2 separate lines. And output is just 1 number 5. If you print extra lines or "The answer is: 5" any such extra characters in output will result in a Wrong Answer. As the judging is done using diff checker.
